

For dealers only

From the first number dealer will do login with otp , so from that number only in future the dealer with dealer code can generate login with otp from that same number only in other device if they want to login , one dealer code can associate with only 1 mobile number and that info will fetch inside my program so in future if dealer that mobile number is lost so from backend my team can add a new number there

Along with the regular features

We create a little bit different ui for dealers , as there is a target type thing also if dealer adds this number of farmers in the application from there refer code , so dealer will be eligible for selected gifts from the clsl upon completing the target

Then a tab for redeeming coupon , when farmer gives them coupon code from their mobile , the dealer will add that in their application to redeem that coupon and in dealer app all that data will be shown how much coupon the dealer has redeemed and in the month end it will show total number of amount redeemed by the dealer , same that thing will shown us in the dashboard , so the the clsl team can generate a credit note according to it, if qr code can be created in free so we generate that and dealer using their phone camera can fetch the code from farmer mobile phone.
