

How login page will work , i will tell you that

Login with otp , will use airtel dlt service , we will keep that in the end after all things completed as it will create a barrier in testing phase

First select the language to continue.

Main thing for login option is to collect data

First name adding option , then contact number adding option

After that select are user normal user , farmer , dealer or other person vary

If selected user so add city , village , or fetch details automatically using location email optional , which social media they use and from where they social media come , we need that data to see they active on which social media so that we can spend most the our reach on that social media

Then direct click on button login with otp and then enter in the application

If selected farmer so

city , village is main to get , and all or fetch location automatically email optional , which social media they use and from where they social media come , we need that data to see they active on which social media so that we can spend most the our reach on that social media

Then a refer code for which dealer will give , the refer code can be enter manually or there is camera option to scan that qr code to auto enter the refer code , it will be written for getting discounts and coupons ask a refer code from your dealer

Then direct click on button login with otp and then enter in the application

If dealer select so

There will be a option adding dealer code , which will be given from my our system end , by generating the dealer code

After adding that dealer code , automatically after processing that dealer info will be reflected and then after clicking verifying dealer that this information belongs to him

Then direct click on button login with otp and then enter in the application

Then once the people enter in the application , if they click on ai inspection first thing ask the location permission if user had not given tell user for more accurate results and show your weather details and then camera permission

As we need location to get farmer location so we can directly reach there

Or once farmer click on the weather part so from there location permission comes , but don't give location permission in very first as people will think we are tracking them and dosing

misuse of location.

Then after that add this animation in the login screen and if looks good so add it in

But make this thing really animated, the person should add pesticides/insection in real by walking and spraying , so this thing remain in whole the applicationi in the below footer side , also on the tank which farmer holding write vertically CLSL

And for now when we press login with otp it should and current if we add 1,2,3,4,5,6 so it will be open till then we not connect it with artile dth
